As the accommodation changes, these two points will move backward and forward, but their relative dioptric position will always be the same. The two meridians, that of the weakest and that of the strongest dioptric power, are called the principal meridians and the object of the test is to locate them exactly, followed by the exact measurement of the power of each. The two principal meridians are easily located when the astigmatism is at all marked, as the edge of light as seen in the pupillary area will then have two edges, opposite one another moderately...
